

Artripul

LIQUID PLANT EXTRACTS TO SUPPORT SKELETAL GROWTH AND JOINT DEVELOPMENT

- **Beneficial for muscles, joints and bones**
- **Removes uric acid from between the joints**
- **Anti-bacterial**
- **Inhibits infection**
- **Prevents collapse due to joint problems**

Composition: Water-based solution of plant extracts for healthy joints.

The rearing of chickens and turkeys for meat has resulted in accelerated growth to the point at which a chicken can be ready for the table in 6-8 weeks. Naturally, such a huge spurt in growth rate has consequences and it is common for the rate of skeletal growth to be unequal to the rate of meat growth. As a result, collapse of the bird due to the stress on the bones and joints is a common cause of downgrading and death. This weakening can be noted at an early stage - it is common for affected birds to let their wings hang.

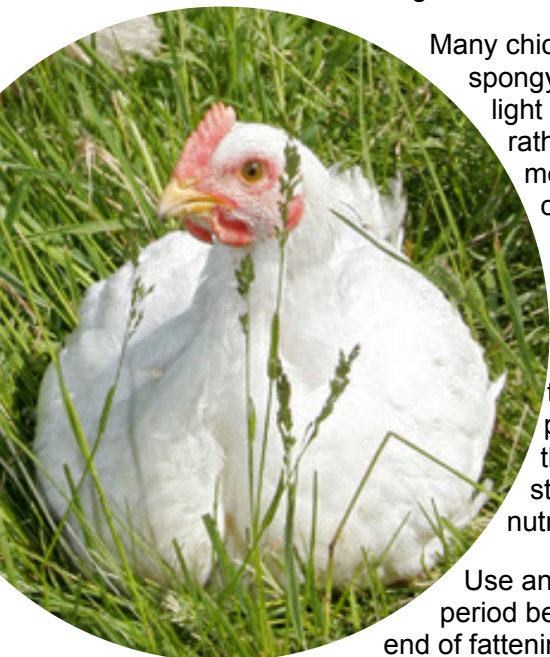

Artripul has been developed to promote the absorption of the necessary vitamins and minerals to ensure that skeletal growth can continue naturally.

Many chicken bones are of spongy construction and very light weight with air chambers, rather than bone marrow. This means that the absorption of calcium and other construction elements is vital to give the necessary strength for body support.

Artripul has been specially developed to counter such problems and is particularly efficient at promoting cytoplasm, the cell fluid, which, in turn supports the bone structure and enables efficient absorption of nutrients.

Use and dosage: 100ml per 1000 chickens over 24 hour period beginning the third week, twice a week until the end of fattening. At critical moments, repeat the treatment a few times every 6 hours.

Presentation: 1 LT plastic bottles.
